

dotnet-api-platform — future state

Icon view · every arrow is a flow · boundaries are boxes · pages 01–05 zoom in, A1 holds the dense wiring

How azure-platform-iac (engine), azure-project-starter (factory) and dotnet-api-platform (flagship) interlock across GitHub, Azure DevOps and Azure

The Guards — what fires on a single API call

Ordered, verified from PlatformAspNetCoreExtensions.UsePlatform + endpoint code · every failure is RFC 9457 application/problem+json

Contract-first & CI/CD — TypeSpec is law, the pipeline is the courtroom

spec → emit → lint → drift-gate → conformance · build once, promote byte-for-byte, approvals not branches

Legend

- required / always fires
- optional · config-gated
- stub · future · planned seam
- scale signal / growth path
- security control
- governance / audit

each rung has an explicit “climb when” signal read from App Insights + Container Apps metrics · never split on RPS alone

dotnet-api-platform — the whole system, wired

One canvas: repos → pipelines → packages → runtime → vendors · the paved road from git push to governed API call · pages 01–05 zoom into each zone
